

2006 Overtime Equipment Truck Application Guide

This chart applies to model years listed, but due to the wide variety of options and combinations you should always measure each vehicle to be sure equipment will fit.

* 6.75 ft box on Ford Super Duty had a inside bed length of 80 inches. The 78" Overtime Bed Rail will fit but there will be a 3 inch gap at the rear of the bed rail to the tailgate.

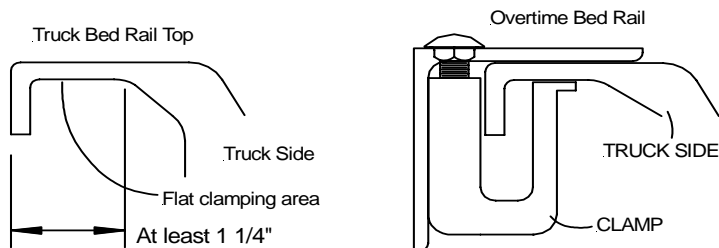

+ Short Box on Toyota has a bubbled bed rail under the plastic rail cap. This bubbled sheetmetal does not provide an adequate surface for clamping bed rails.

@ Overtime Headache Racks require 20" or longer bed rails that fit the truck for mounting.

Installation under cross mounted toolboxes - Overtime bed rails will work with most toolboxes, but measure to be sure. Overtime bed rails narrow the top of truck beds by 1.5" with the bed rails installed, 3/4" on each side. To use with a toolbox there needs to be at least a 1" between each side of the toolbox and truck bed side to install our full length bed rails. Alternatively the 74" Bed Rail can be installed behind 20" toolboxes in 8 ft truck bed. Always measure at the front of the bed where the toolbox will be installed.

Overtime Bed Rails will fit other trucks as well. To determine if they will fit a particular truck, measure the dimensions as shown in the fitting and clearance diagrams. Compare measurements to the OTHER TRUCKS column in the application chart. All measurements are in inches.
